The Campbell River and District Division of Family Practice wants to ensure that all people during this extraordinary time get medical care how you need and when you need.

Family physicians, nurse practitioners, and walk-in clinics are available to provide care to patients by using telephone or video during the COVID-19 pandemic but many are also providing in-person appointments or will refer you to a clinic that does.

There are several options available to meet your unique health care needs in a safe way!

Call your clinic office for more information!

Do you need non-COVID (regular) medical attention?

Please do not put off medical appointments and check ups/follow ups if you have concerns.

Your health is important to us and we have safe ways to address your ongoing concerns as needed.

Do you have mild COVID-like symptoms (new cough, some shortness of breath, and/or a fever) and need medical attention for other concerns?

Campbell River now has an Assessment Clinic open for patients with mild COVID or respiratory symptoms that need to be seen in person for other medical reasons.

Talk to your family doctor, nurse practitioner, or walk-in clinic.

A referral from your provider is required.

To book an appointment, call your primary care clinic office number. The medical office staff will walk you through how the visit will work, whether it is on telephone or video, in-person or a referral to the Assessment Clinic.

The important thing is not show up at the clinic office's door. Always call in advance.

Additional Tips:

If you are concerned you may have COVID, a self assessment is available at: https://bc.thrive.health and you can talk to a doctor, nurse practitioner, or call 8-1-1.

Additional services in response to COVID 19 are being made for rural and remote community members.

Ask at your local clinic.

Scheduled vaccinations are still taking place.

If you have questions or concerns, please contact the Public Health Centre at (250) 850-2110

For seniors living at home, those with disabilities, or people at high-risk, it is important that you contact your healthcare provider for advice if you have not already connected.
